

Connecting To Your Wireless Router on Window 7

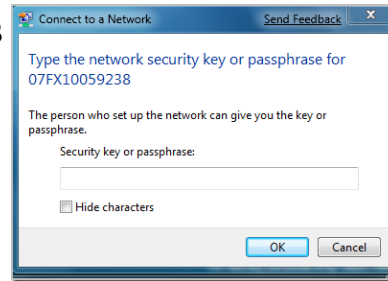

First of all make sure that you have unplugged the Ethernet Cable. Once this has been done, then locate the following symbol in the bottom right hand corner of the screen. 

Once you have done this you will have the screen below (diagram A)

A

B

From screen A, simply locate TP LINK under the Wireless Network Connection section. Click and highlight this, then click on Connect. Once you have done this it will ask you for your wireless key (B). Type in your Wireless Network Key (see the top of this guide), once done click connect. After a couple of minutes it will tell you it has successfully connected. From here, just close any open windows and you are now connected wirelessly.
